

Name: Molly Killilea

Webpage Choice and Explanation: Portfolio. I chose to build a portfolio website because I am required to create a portfolio to earn my MS in Learning Technologies and Design. This gives me a headstart.

Boxes with squiggles in them are paragraphs/text boxes. Headings are identified as "HEADING". Text that I would like to emphasize but isn't necessarily a heading is labeled as "LARGE TEXT". Boxes with a sun in the corner are images. Image boxes with squiggles in them represent a text overlay (over an image).

Home

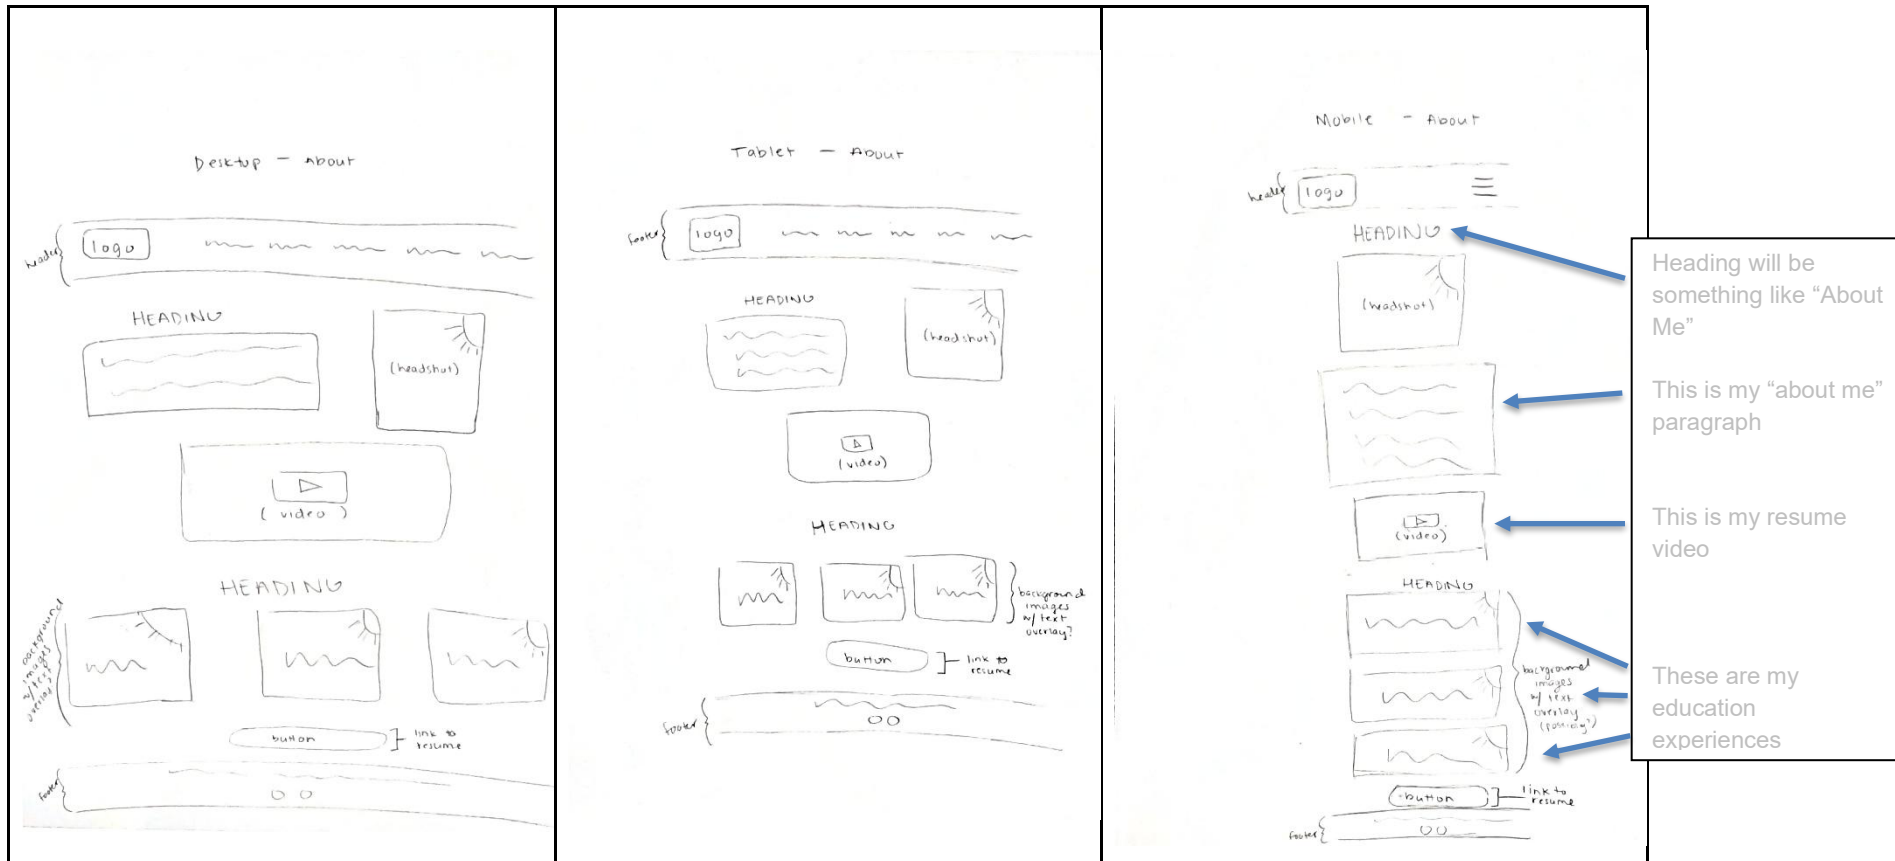

I'm picturing this HEADING to be something like, "Hi, I'm Molly!" and the text below it will be my welcome statement

The home page starts with a Hero section to capture the viewer's attention. A heading and welcome statement will be overlaid on a background image on all formats. I may use a button to link to the contact form ("let's chat!") or to the about page ("learn more"). It then progresses to my purpose and goals, and a favorite quote. For every webpage, the header consists of the logo and navigation menu. The footer consists of some contact/social media information.

For the home page, the tablet version is very similar to the desktop version, except the text box containing my purpose and goals was reformatted to be one column of text instead of two, to make it a bit more vertical. The mobile format is similar, but the hero section is center aligned to better fit the screen. The mobile version will require much more scrolling than the other versions.

About

For the about page, I start with an "about me" paragraph and headshot. I then move to the resume video, which will be embedded in the page. Following that, I present my educational background. For this, I'm considering laying text over a background image related to each experience. Finally, I have a button that links to my PDF resume. The desktop and tablet versions are both oriented horizontally; the tablet version is basically just scaled down to fit the screen. On those versions, the about me paragraph is placed to the left of the headshot and the educational experiences are organized into three columns. The mobile version stacks each element vertically, starting with the heading before moving on to the headshot and then the about me paragraph. The educational experiences will be ordered from most to least recent.

Projects

Desktop - Projects

Tablet - Projects

Mobile - Projects

Heading will be something like "Recent Projects"

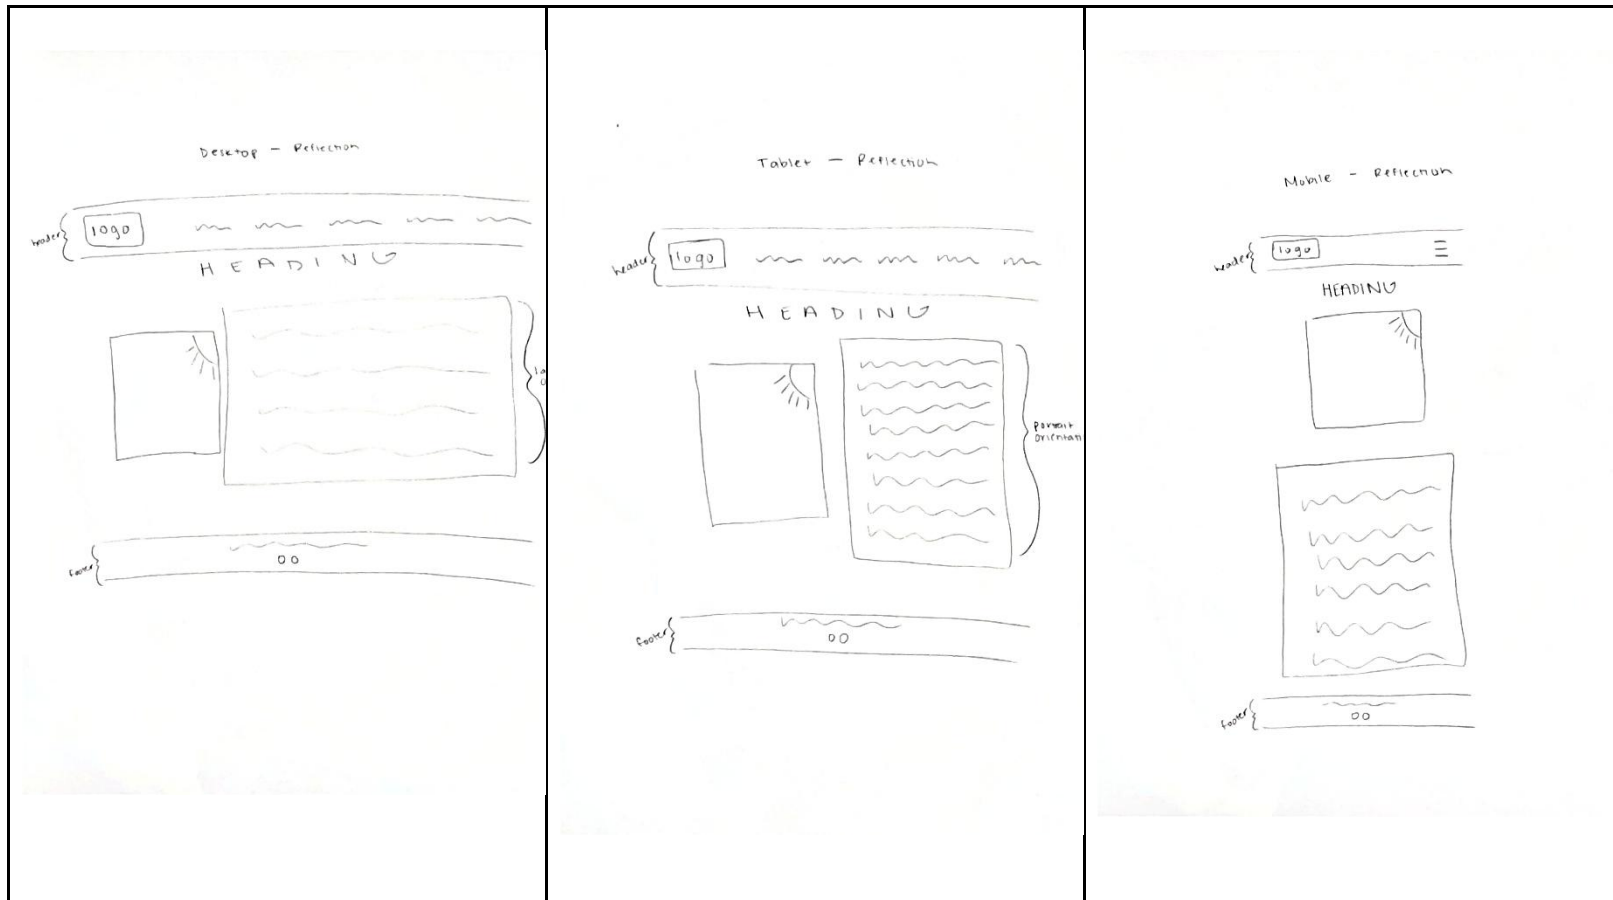

Each LARGE TEXT will be the title of the project

Each image will be a project artifact

Each text paragraph following that will be the description and reflection

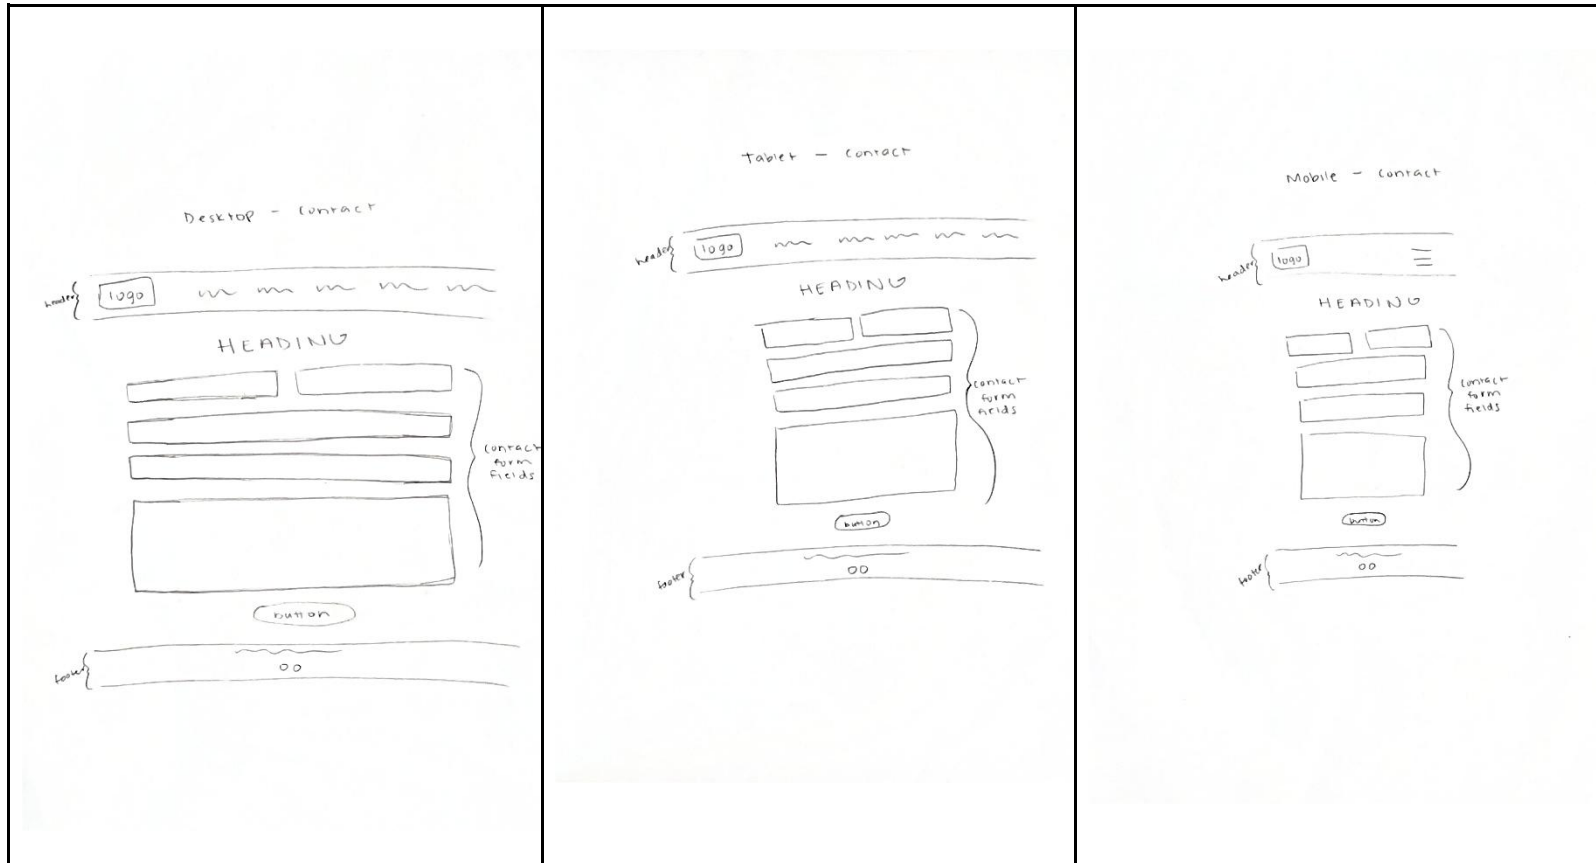

The projects page starts with a "projects" heading and then my "best" project. Each project will have a title and then the explanation and reflection paragraphs. I'd like to play around with using an expandable/collapsible section for the description and reflections because I think it might be nice to reduce the amount of text on screen at once, especially in the mobile version. It would be like a "learn more" function. For the first project, I will include a button that links to the project itself so viewers can try it out. For the desktop and tablet versions, I'm planning for text to be aligned next to the project artifacts. The tablet version will be scaled down and each text box will be more portrait-oriented than landscape. For the mobile page, each project will start with the title, then the artifact, then the text, so it isn't visually squished.

Reflection

The reflection page will start with a heading ("reflecting on my work" or something along those lines?). For the desktop and mobile versions, the reflection text will be oriented next to a visual of some sort. The tablet version will be scaled down and the text box will again be more portrait-oriented whereas the desktop version will be more landscape. For the mobile version, the text will be aligned below the visual.

Contact

The contact page is extremely similar across all three versions. It will have a heading encouraging the viewer to contact me, and then a contact form with empty fields such as name, email, and message. The only real difference between each version is that the contact fields will be scaled down from the desktop version (the desktop version will have the widest boxes for each field, and the mobile version will have the thinnest).
